Informasi artikel	ABSTRAK
<i>Sejarah artikel</i>	Lokasi Indonesia berada diantara empat lempeng dunia, diantaranya: Eurasia, Indo-Australia, Philipina, and Pasifik. Subduksi antar lempeng membuat Indonesia rawan terjadi peristiwa alam seperti erupsi gunung berapi. Salah satu daerah rawan bencana erupsi gunung berapi adalah Kecamatan Ngancar, Kabupaten Kediri. Kasus ini karena lokasi Ngancar dekat dengan lereng kelud. Partisipasi masyarakat untuk upaya mitigasi sangat penting untuk mengurangi dampak peristiwa alam. Tujuan paper ini untuk mendiskusikan bentuk dan tingkat partisipasi masyarakat di Kecamatan Ngancar dalam upaya mitigasi bencana erupsi gunung Kelud. Penelitian berjenis survey dengan sampel 100 dari 5340 kepala keluarga. Pengumpulan data dengan wawancara dan dokumentasi, selanjutnya dianalisis dengan deskriptif kuantitatif dilengkapi skoring dan persentase. Hasil penelitian menunjukkan bahwa masyarakat di kawasan rawan bencana I, II, dan III mendapat skor partisipasi masing masing sebesar 1.425, 935, dan 1.133. Kegiatan partisipasi, meliputi: elucidation disaster, organizing disaster preparedness, preparing self, making early warning system, dan saving property.

Keywords:	Indonesia location is between four plates, there are: Eurasian, Indo-Australian, Philipines, dan Pasicic. Subduction between plates make Indonesia disturbed a natural incident such as mountain eruption. One of disturbed mountain eruption disaster area is District Ngancar, Kediri Regency. This case because Ngancar location near Kelud slope. People participation for efforts mitigations is very important for reduced natural incident impact. The aim this paper to discuss form and level people participation in District Ngancar for efforts Kelud mountain eruption disaster mitigation. This research is survey with sample 100 from 5.340 head family. The data collected with interview and documentation, then analized by quantitative description with scoring and percentage. The research result showing that people in disaster disturbed zone I, II, and III get participation score each the amount of 1.425, 935, and 1.133. The participation action, include: elucidation disaster, organizing disaster preparedness, preparing self, making early warning system, and saving property.

Introduction

Natural incident occur in Indonesia. That incident, such as: earthquakes, tsunamis, volcanic eruptions, landslides, droughts, and floods. Earthquakes, tsunamis, and volcanic eruptions are natural incident associated with tectonic activity. This is reasonable because Indonesia located

between four tectonic plates, there are: Eurasian, Indo-Australian, Philipines, and Pacific. Plates push each other (converging) causes the tectonic and seismic activity. According to Kusumayudha (2013) active volcanoes in Indonesia formed by three main world's plates, there are: Eurasia, India-Australia, and Pacific.

Until now, humans have not been able to stop the emergence of hazards. Not only cause of its extraordinary strength, but also the time difficult to determine precisely. Natural incident is said to be a disaster when there are victim. Conditions in the human at Region can be predict the victim probability. According to (Awotona, 1997) natural disasters are the interaction between natural hazards and vulnerable condition. According to Marahatta (2012), can be predicted if an 5.7 Richter scale earthquake hits Kathmandu, approximately 40,000 people will die, 90,000 people will injuries, and 60% the existing buildings will collaps.

Humans have the ability to recognize and understand natural incident. The action is one of effort to reduce the level of damages or victim caused by a natural disaster, or often referred as part of disaster management. According to (Coburn, Spence, & Pomonis, 1994) public awareness and the local government understanding level very important to reduce the impact of the disaster. According to (Kusumayudha, Lestari, & Paripurno, 2018) the use of SMS gateway is expected able to increase public and government awareness in order to reduce risk and disaster victims.

A variety of natural disaster hazards that comes without planned, Indonesian people living in disaster disturbed areas should prepare for a natural disaster to minimize the victims. One form of preparation is mitigation. According to Indonesia Law No. 24 of 2007, mitigation is a series of efforts to reduce disaster risk through physical development and awareness or increase to face disaster ability. According to (Slameto, 1995) readiness is a prerequisite to learning the next human be able to interact with certain way.

One of natural disasters always happened in Indonesia is volcanic eruption. Indonesia has 125 volcanoes and 83 are active until now. One of the active volcanoes in Indonesia is Mount Kelud. Kelud has the characteristics one eruption but strong. According to (Yulaelawati & Shihab, 2008) said the volcano if had volcanic activity as well as

the special features such as hot springs, craters, cones, and smelled of sulfur vapor sources. According to (Sukadarrumidi, 2010) the type of eruption that occurs is influenced by many factors such as the viscosity of the magma, gas content in the magma, the influence of ground water, and the depth of the magma chamber.

Since 1900 until now Kelud erupted seven times, at: 1901, 1919, 1951, 1966, 1990, 2007, and 2014. Kelud did not follow the character in 2007, because the eruption is effusive with lava dome mixed thick white smoke from the middle of the crater. According to (Noor, 2009) the peculiarities Kelud is the lake crater (until 2007) which makes eruptions highly liquid lava and endanger the surrounding population.

Kelud caused more than 15 thousand inhabitants, since the 15th century. Human lives victims more than 10 thousand in 1586. Almost every eruption of Mount Kelud set Disaster Disturbed Areas in Kediri, spread over four districts, there are: Ngancar, Puncu, Kepung, and Plosoklaten. That because the location close to the crater and in the flow lava direction (west to south). According to the Center of Volcanology and Geological Disaster Mitigation (PVMBG) Kelud in 1990, Ngancar District have total human victim 14 from 32 or 44%, in 1966 eruption, there were 107 people die or 51%. According to (Sukadarrumidi, 2010) the impact caused by the volcano eruption gave positive and negative impact, one of the negative impact is the loss of life.

The most vulnerable risk population of Kelud eruption in Kediri is Ngancar District by 3,656 populations. Distance Sugihwaras village, Ngancar District also closest to mount Kelud peak of 4.9 kilometers. Villages in Ngancar district also the largest entry in disturbed area as many as 6 from 14 villages that spread over four districts. The level of largest risk eruption of Mount Kelud (Area 3) all located in the Ngancar district, there is Sugihwaras and Sempu Village.

Ngancar district people in addition to getting the blessing of fertile land, also had to be

prepared for the eruption of Mount Kelud in order to reduce or eliminate losses. Ngancar District people preparedness can be public participation in the efforts related eruption mitigation. According to (Sugandhy & Judge, 2007) people involvement in planning the utilization of natural resources and the environment, encouraging active participation.

Participation in this paper is all action, participation of the public on disaster preparedness eruption of Mount Kelud. Preparedness is for himself or organizations that participated in the community. According to (Artiningasih, 2008) the participation purpose to increase public awareness of the role and shared responsibility in determining the safety of self and family.

Method

The method that was used is survey in Ngancar District. The research was conducted in November 2012 and updated in February 2017. The population is 5,340 families. The sample calculation results with Slovin formula in (Setiawan, 2007) is 100. Then samples were taken by proportional random sampling technique of disaster disturbed area (III, II and I) respectively by 31, 30, and 39.

The primary data is people participation shape obtained by interviews with the questionnaire. Secondary data are common conditions such as: the number of population, area, map, victims of Mount Kelud eruption. Secondary data were obtained by documentation from institutions: the central statistics, the national disaster management agency (BNPB), district office, and photos. Data were analyzed by descriptive quantitative with scoring equipped percentage.

Result and Discussion

Result

Participation is all forms of people action in disaster response preparedness activities to the threat of Mount Kelud eruption. Engagement can be a mental and emotional involvement and also

physical in use all the capabilities it has in all the activities carried out and supports the achievement of goals and responsibilities for all involved.

People participation in the threat of Mount Kelud eruption consists of five indicators. (1) Action in following outreach activities on disaster. (2) Action in organizing community disaster response. (3) Action in preparing for disaster response preparedness. (4) Action in an early warning system. (5) Action in an attempt to save possessions.

Firstly, action or something that is done when there are extension activities or disaster simulations. Acts committed that can be active or passive. Action parameters are: participation, attitude when extension, and participation (to prepare equipment and supplies) in extension activities or simulations. People participation in Ngancar District in extension activities and the greatest disaster simulation in the area III is 74.2%, II 16.67%, and 33.33% I.

Attitudes conducted during counseling activities in area III have been better than area II and I. This because people in Area III think that counseling is important to face the impending eruption, considering the region closest to Mount Kelud. People participation in providing the basic needs of both throughout area no people become remain donator for extension activities. Residents only contribute helped needs/equipment, Area III (51.62%), II (3.33%), and I (28.2%). Most of the population in area II never helped the extension activities because they think the region will not be affected by lava from Mount Kelud. Because of that, they feel no need to engage in providing extension activities equipment.

The second, action or activity in organizing communities disaster response facing the threat of eruption of Mount Kelud. Organizing disaster response in area III (45.16%), II (26.67%) and I (64.1%) people follow the social organization. People in area are the most in the following community organizations because the more

population and more accessible area of the vehicle. This causes the public easy to perform association or organization. The organization, there are: Youth, Women's, Community Leaders, Indigenous Organizations, Youth Masjid, Religious study groups, and also the Association of the elders. Elders some 30 people gathered once a year, when there will be Kelud larung sesaji event held once a year.

Average routine follow associations or organizations in every area at monthly. Activities undertaken related to cope with disasters by creating a safe evacuation plan. Providing the necessary needs (food, clothing, medicines, and tents), for area II without medicine.

Third, any measures undertaken preparedness before a disaster occurs. Measurement of action, including: participation in following the development of Mount Kelud activity; The main ingredient earthquake-resistant houses volcanic and lava flows; action as it happens signs Kelud will erupt (such as volcanic earthquakes); and action taken if Mount Kelud erupted suddenly.

Population in area III and I respectively of 56.61% and 53.85% always follow the development of Kelud and follow the instructions of the government, while in area II is 23.33%. The all house in all area are made from wall with a foundation of stone. In the event of volcanic earthquakes are mostly just out of the house, specially in area III (41.94%) out of the house and away from the tree to avoid falling debris of fallen trees.

If Mount Kelud eruption there is 45.16% of people in area III would leave their homes if the lava flow has reached his home. According them if the lava flow has not reached their home means home is still safe and do not need to evacuate. But in area II and I respectively of 93.33% and 89.74% displaced to locations that have been set by the government, both the danger is imminent or not.

Fourthly is the creation of early warning system to detect Mount Kelud activity. Give

warnings to prevent victim. Indicators action in establishing early warning systems, there are: forms, public participation in the making, and cared.

Form of early warning systems in all area is a siren with an average of 76.75%. Other shapes such as gong and microphone. Most people have never participated in making the early warning system. Treatment most if there is spare time, while for the area I and II 56% don't know and never cared for the existing early warning system.

Fifth, in addition to save self, the efforts action to save property such as: money, securities, and livestock. Most communities in the study area had livestock such as cattle. The government usually prepare a special refugee camps livestock.

If at any time the eruption of Mount Kelud people in area III (67.74%) and II (83.33%) only save self, but at area I (30.77%) save all assets owned. It shows that community participation in area I in terms of saving asset better than in area III and II.

Based on the results of scoring five indicators, then for participation in community disaster preparedness Ngancar District can be seen in the following table.

Tabel 1. Level of Public Participation Ngancar District

Indicator	Area		
	III	II	I
Action in following extension activities	230	136	213
Action in organizing disaster response	254	208	344
Action in preparing/disaster response	345	326	448
Act. in establishing early warning sys.	220	196	276
Action in an attempt to save assets	84	69	114
Total Value	1133	935	1425

People participation in disaster response preparedness is low because minimum village socialization about disaster counseling. Besides that low people participation in the area II because the majority of people are in migrants, thus less concerned about the action or attitude on disaster response preparedness. The low participation in rescue possessions to make the score decreases. Most people (> 90%) in the

three dangers area of letting livestock also other possessions and more concerned about safety self.

Discussion

Area III is the closest to the Mount Kelud which is just 5 km from Mount Kelud crater. Scores of people participation is 1133. Area III does not have the highest participation scores for saving property classified as very low. Most people prefer to think of the safety of lives than their possessions, including livestock. So when the eruption of Mount Kelud, the livestock they have to be left alone. According to (Norfita & Krol, 2014) people around Mouth Merapi prefer to not consider about the loss, but the eruption occurrences still give effects on their way of thinking, people realized that life was not only about prosperous.

When viewed by age, people are mostly the elderly (61.29%) aged over 40 years. Motivation is reduced because some old age creates lazy to pass through steep and rugged terrain so that they only focus on work. According to (Slameto, 1995) the individuals awareness to follow program influenced by physical conditions.

Majority people have experienced Kelud disaster much as two to three times. Based on these events they took the lessons of the disaster, so they do not think to participate in extension activities. Based on research data showing that time people stay is 41.94% between 41-58 years. According to (Vardiansyah, 2008) the experience allows someone to know and that result is then called knowledge.

Based on the description above, which affect the low level of people participation on disaster response preparedness in area III are age, occupation and income, education, and terrain conditions. Conditions rugged terrain and steep will make people the difficulty in reaching the location of the extension, so that they would prefer to opt out of counseling or disaster response participation. Participation is a non-

physical effort in minimizing the disaster. According to (Harijono, 2011) mitigation measures can be divided into two main parts, namely the mitigation of structural/physical and non-structural/nonphysical.

Area II distance 10 km from Mount Kelud crater. People participation in disaster response preparedness score is 935. Indicators that make the low level of participation in area II than area III and I for longer stays shorter society. People in area II participation levels to follow the extension activities including low because can't socialize or understand the conditions around their homes because not long lived in the area so that the sense of belonging and attachment to the place is still lacking. According to (Edi, 2003) refers to the experience of knowing how a certain way and may increase the interest of study related activities.

People in KRB II, most have never experienced eruption disaster, because the time stay in the area is still less than 22 years. If people have to stay a minimum of 22 years ago it would have experienced Kelud eruption in 1990 and in previous years. This can be seen when the siren sounded in 2007, people didn't directly to save zone. According to (Harijono, 2011) if the early warning system alarm sounds, people should immediately leave the area of disaster preparedness towards safety radius set by the government.

Based on monograph data Ngancar District in 2011, people in area II 913 from 1.575 households (58%) are migran from another places. So for people who are not familiar with the area does not provide a large enough participation in all activities, especially in terms of outreach activities on Kelud disaster. Low participation because of low interaction and a sense of belonging to environment surrounding. According to (Kusumayudha, Lestari, & Paripurno (2018), because the volcano not active for long time, people around Mounth Sinabung not prepared yet to facing the eruption. It is same as the migran who don't have experience.

Area I is region or danger zone that is within 15 km from the summit of Mount Kelud. This area get the highest participation community score (1.425). Society has a level of experience of the disaster that was because of the high long stay mostly from birth. It makes people have high experienced about efforts Kelud disaster. Physical conditions in disaster disturbed zone I was more flat topography. People more easily to reach locations. According to (Coburn, Spence, & Pomonis, 1994) one form of people participation in efforts eruption mitigation is the volcano awareness.

All area leaving the entire property and is more concerned with personal safety. Kelud has signs before eruption. Prior to the category of alert, the public should begin to evacuate animals and bring treasures. In 2014 after an explosive eruption a few military patrol keeping homes in the affected areas from looting. Possessions need to be saved for the purposes of post disaster or recovering from disaster. According to (Sari, 2010) the impact is not prolonged required the recovery environmental process and people who get impact or disaster.

Participation is important to mitigation. Eruption 1990 and previously was a lot. After 1990, in 2007 (effusive) and 2014 (explosive) there were no dead people victim in Ngancar District so did Kediri Regency. There are victim people deaths caused by the volcanic ash affected by respiratory problems, 2 people in Blitar Regency. According to (Kusumayudha, Lestari, & Paripurno, 2018) to reduce the risk, such a countermeasure should be developed especially that directly involving local people participation. According to (Setiawan, Kingma, & Westen, 2014) one of ways to reduce victim in the landslide disaster is participation of NGOs in disaster activities because helping the community when disaster strikes and enhancement of dissemination about landslide to the local community. According to (Hariyono, Liliyasi, Tjasyono, & Madlazim, 2016) courses accordingly can help student to improve their participations

to solve problems of volcanic eruption crisis in the society.

Conclusion

The research result showing that people in disaster disturbed area I, II, and III get participation score each the amount of 1.425, 935, and 1.133. Area III got the big two because the zone is closed with Kelud crater. Closed zone but no biggest score that because the location is steep with low accessibility, so they no always can acces elucidation place. Area II got the lowest score because majority people are immigrant. Although Area I the most far from Kelud crater, but almost all people born there. This can become them wary with story from their family who experienced the powerful eruption (example in 1990). Another reason the establish area I highest score is elucidation place easy to access by people.
